

Customer Success Case Studies.

Case Study 1: DB Insurance and SAS

1. What was the problem?

DB Insurance struggled to detect organized insurance fraud. Traditional methods relied on manual investigation, making it difficult to identify connections between fraudulent claims.

2. What was the solution and implementation?

The company implemented the SAS Fraud Decisioning platform with AI and network analytics.

The system combined claims, customer, and vehicle data to automatically identify suspicious relationships and assign fraud risk scores.

3. What were the results?

The new system reduced investigation time from several hours to about two minutes. SAS also reported a 99% improvement in fraud detection accuracy and allowed investigators to review many more cases.

Case Study 2: University of Dayton and Alteryx

1. What was the problem?

The University of Dayton collected data from many different systems, making reporting slow and time-consuming. Staff spent too much time preparing data instead of analyzing it.

2. What was the solution and implementation?

The university implemented Alteryx to automate data preparation and reporting. The platform combined data from admissions, finance, housing, and student services into automated workflows.

3. What were the results?

Reporting that previously required two days was reduced to about 30 minutes. The university also improved decision-making and reported a 3% increase in student retention.

Conclusion

Both case studies show that analytics helps organizations solve complex business problems by improving efficiency and supporting better decisions. As data continues to grow, analytics tools such as SAS and Alteryx will become even more important for organizations across many

industries.
